Nexus Global Enterprise

AssetRack Integration Test Data payload

DOC-ID: AR-TEST-001 STATUS: SYNTHETIC DATA DATE: SEP 2026

Test Objective: This document serves as the standard data injection payload for testing the parsing, mapping, and policy-enforcement modules of the AssetRack System (v2.1). The content below simulates a standard corporate hardware allocation matrix and HR liability policy framework.

1. HR Asset Management Policies

The following HR policies govern the distribution, maintenance, and retrieval of IT assets assigned to Nexus Global personnel. These rules must map directly to the automated approval workflows in the rack system.

HR-POL-01: Asset Ownership & Liability

All hardware (laptops, monitors, peripherals) remains the exclusive property of Nexus Global. Employees are responsible for safeguarding their assigned devices against theft, loss, or negligent damage. In the event of loss, the employee must report the incident to IT Support within 24 hours via the internal portal to trigger a remote wipe protocol.

HR-POL-02: Remote Work Allocation

Employees classified as "Remote" or "Hybrid" in the HRIS are entitled to a secondary home-office stipend or direct allocation of peripheral bundles (1 external display, dock, ergonomic keyboard/mouse). This bundle is automatically approved during onboarding but requires annual verification.

HR-POL-03: Offboarding & Asset Retrieval

Upon termination of employment (voluntary or involuntary), all assigned IT assets must be returned to the nearest regional IT staging rack within 3 business days. Failure to return high-value Tier 1 devices may result in the deduction of the asset's depreciated value from the final payroll settlement.

HR-POL-04: Refresh Lifecycle

Standard issue devices are subjected to a 36-month refresh cycle. High-performance developer units operate on a 24-month cycle to ensure compute efficiency. The rack system must generate a swap alert 45 days prior to the expiration of the current cycle.

2. Job Roles & Allocation Rules

This table acts as the logic matrix for the AssetRack provisioning engine. The system evaluates the user's Department and Job Role against this table to determine automatically which hardware tier they are authorized to requisition from the smart lockers.

Job Role / Title	Department	Hardware Tier	Primary Device Profile	Refresh Cycle
Software Engineer (L1-L5)	Engineering	Tier 1	High-Performance Laptop (MacBook Pro 16" or Precision Mobile Workstation)	24 Months
Data Scientist / ML Engineer	Data & Analytics	Tier 1+	GPU-Accelerated Mobile Workstation (ThinkPad P-Series)	24 Months
Account Executive / Field Sales	Sales	Tier 2	Ultra-mobile Premium (MacBook Air or ThinkPad X1 Carbon)	36 Months
HR / Finance Analyst	Operations	Tier 3	Standard Enterprise Laptop (Dell Latitude 7000 Series)	36 Months
Customer Support Rep	Customer Success	Tier 4	VDI Thin Client or ChromeOS Device	48 Months

Exception Workflow Rule

If an employee requests a device outside their designated tier (e.g., a Finance Analyst requesting a Tier 1 MacBook Pro), the rack system must place the request in a "Pending" state and generate an authorization webhook payload to the Department Head and the IT Finance Controller.

Device Issuance Logic (Pseudocode)

```
IF employee.status == "ACTIVE" AND employee.role_tier == rack.device.tier:
rack.unlock_bay() inventory.update(device.id, employee.id, status="ASSIGNED") ELSE:
trigger_exception_workflow(employee.id, requested_tier)
```

3. Hardware & Software Requirements

The system must track the baseline specifications and required compliance states for all deployed assets. The table below represents the dummy data for the configuration requirements of each Tier.

Tier	Processor (CPU)	Memory (RAM)	Storage (SSD)	Required Base OS
Tier 1+	Intel Core i9 / Apple M3 Max	64 GB	2 TB NVMe	macOS 14 / Win 11 Pro
Tier 1	Intel Core i7 / Apple M3 Pro	32 GB	1 TB NVMe	macOS 14 / Win 11 Pro
Tier 2	Intel Core i5 / Apple M3	16 GB	512 GB NVMe	macOS 14 / Win 11 Pro
Tier 3	Intel Core i5	16 GB	512 GB NVMe	Windows 11 Enterprise
Tier 4	Intel Celeron / ARM	8 GB	128 GB eMMC	ChromeOS Flex

Mandatory Software & Compliance IT Rules

Every asset dispensed from the rack system must be verified against the following compliance checklist via the Mobile Device Management (MDM) API before the user profile is completely activated:

- **Endpoint Detection and Response (EDR):** CrowdStrike Falcon or SentinelOne must be installed, active, and reporting to the console.
- **Disk Encryption:** BitLocker (Windows) or FileVault (macOS) must be enforced with recovery keys escrowed in the central IT vault.
- **VPN Client:** Pre-configured split-tunnel VPN client with Single Sign-On (SSO) integration.
- **Asset Tagging:** The physical asset tag barcode must match the serialized entry in the rack system's database. Scanners must reject mismatches.
- **Local Admin Rights:** Revoked by default for Tiers 2, 3, and 4. Tier 1 users may request Just-In-Time (JIT) admin elevation.

> **System Integration Note**
>
> When writing automated tests against this data, ensure that your mock MDM API returns a `200 OK` with a `compliance_state: true` JSON flag to successfully clear the deployment gate for Tier 1 through Tier 3 devices.
